

TAU 250 SLIM R

Remote programming on enabled control panels with built-in receiver or on external radio receivers with this feature

If an already programmed RP-type transmitter is available, this feature allows to program quickly a new transmitter. Follow these steps (you must be close to the radio receiver/controller to perform successfully the remote programming).

In the already-working radio remote control, press and hold the button (for at least 6 seconds) that is normally used to control the automation till the green LED turns ON, then OFF, and finally starts flashing. Then release the button

Now, on the new radio remote control, press the same button used in the working radio remote control. At the end test the automation to check its operation and repeat the procedure as required

WARNING: when a transmitter is programmed on more than one receiver, it can happen that the gate operator does not react to the command. This is due to a misalignment between receiver and transmitter. To restore normal operation, proceed as follows: 1_ press the pushbutton in the transmitter; 2_ release the button and wait for the LED to turn OFF; 3_ within 5 seconds from the LED turning OFF, press again the pushbutton in the transmitter.
